

## Radio Nurse Call receiver

The radio receiver is designed to work with existing nurse call systems. The radio receiver interfaces through the local call point bus which makes integration extremely simple. The command messages of a radio key will activate the alarm through the local call point connections C and D. There is no requirement to program the radio keys as the radio messages will be validated by command and device type only. The radio receiver unit will accept a valid Alarm depending on what the hardwired call point is set to e.g. **Call** = Call alarm, **Emergency** = Emergency alarm. If the cancel button is pressed on either the hardwired call point and or the wireless call point it will cancel that particular alarm.
